Creating a program to extract and aggregate news from various sources in Python and making it accessible through an API involves several steps. Here's a high-level plan to guide you through the process:

1. Requirement Analysis and Planning

Identify News Sources: Determine which news websites or APIs you will be aggregating from.

Define Scope: Specify the kind of news (categories, regions, languages) you want to aggregate.

Compliance and Legal Considerations: Check for any legal restrictions or API usage policies of the news sources.
